PLASTIC PROFILES

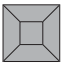

Plastic profiles are used for construction of pastures, paddocks and stables and further for construction of different types of fencing, pergolas, benches, composting boxes, sheds, etc. Also they are used in construction of noise prevention walls, rock falling barriers and palisades. In towns, the profiles are employed in construction of council mobiliary and in landscape architecture. The profiles are highly weather resistant, they are resistant to moisture, decay, moulds, fungi, parasites and are inert to common chemicals. They are not

water-absorbing, their surface can be cleaned easily and they, from a long-term point of view, do not require any maintenance. They can be cut, drilled and connected by screws and worked by common woodworking or metalworking tools. It is recommended to follow all safety regulations applying to work with the tools. Commonly the produced profiles are brown. On request, however, they can be made in grey, brick-red, black or green colours.
